Suitable for Wetrooms

Lightweight

British manufacturer launches wetroom solutions.

Polyfab Coatings & Systems Ltd, the only UK manufacturer of low profile shower trays and thermal tilebacker boards, has launched its own range of tileable wetroom solutions.

PCS has many years experience of producing cement reinforced polystyrene products and have used this expertise to capitalise on the rapidly growing demand for tileable wetrooms.

The PCS Wetroom Solutions allow you to create your tiled wetroom without the need for the conventional white step in shower tray. The surface of the PCS tray is machined to provide the necessary falls to the drain position. The lightweight but high compressive strength foam core of the tray is coated with a flexible cement coating and reinforced with a glass fibre mesh. This produces a tough, waterproof and tileable surface. A waterproofed and sealed system will eliminate any concerns regarding damp penetration or water ingress to the rest of your property.

The wetroom kits come complete with pre-machined trays, wastes, insulation boards, fixing and waterproofing adhesives. Comprehensive fixing instructions are included and the UK based helpline is always there to provide assistance.

Being UK based PCS doesn't just give the benefits of understanding the UK market and providing excellent customer service. Due to recent currency fluctuations they now have considerable cost advantages over the imported competitor products.

The location of the drain and routing of the waste pipe are important considerations when designing your wetroom. In properties with concrete floors it may be necessary to raise the level of the showering area to avoid the need to excavate to accommodate the waste water pipe and drain body. To simplify such installations PCS has incorporated Raised Platform solutions into its range. These Raised Platforms allow you to locate the drain and route the waste

water away in any direction as the foam platform is easily modified with simple hand tools. Of course you may wish to utilise the 'step up' feature of the Raised Platform as part of your wetroom layout.

In properties with wooden floors the Level Access kit enables you to create the aesthetics of the true wetroom experience. The tray is sunk into the floor by removing the floor boards. The drain body and waste pipe are then positioned below floor level. A new level floor, flush with the top of the shower tray, is created by laying Polyfab's thermal tilebacker boards over the remainder of the room. With this layout the entire floor becomes a waterproof system.

Not only are these systems waterproof, they are also extremely good thermal insulators. You can add electrical underfloor heating into your wetroom to produce a truly luxurious environment and the thermal properties of the PCS Wetroom kits will greatly reduce the running costs of the heating system.

The kits are designed to be a 'wetroom in a box' solution but all the items in the kit can be bought individually, or the kit added to, to meet your individual requirements.

Polyfab Coatings & Systems has produced its thermal insulation tilebacker boards for many years. They are used throughout the UK electrical underfloor heating market to prevent heat loss to the building sub-structure and allow the room to quickly achieve the desired temperature. PCS is also very active in the UK leisure industry where its range of standard and bespoke foam products are used as seating and structural items in such areas as steamrooms and spa environments
